

Design Principles

aka Object Oriented Programming

July 4, 2017

Encapsulate what varies.

- Encapsulate ...
 - Restrict outside access to a things parts.
 - Bundle operations with the things they use.
- ... what varies.
 - This refers to source code.
 - Source code varies due to changing requirements.
 - Requirements change for a lots of reasons.
 - E.g. A change in government may cause a change in tax law.
- Restrict outside access to parts of the source code that might change due to changing requirements.
- “what [do] you want to be *able* to change without redesign?”
(Gamma et al, 1977)

```

class Product {
  public price: number;
}

// We have encapsulated the calculation of tax.
class TaxCalculator {
  public calculateTax(product: Product): number {
    const tax = 0;
    // Do the calculation of tax,
    // which will likely change over time.
    return tax;
  }
}

class FarmStand {

  private cart: Array<Product>;

  public DisplayGrandTotal(): number {
    const taxCalculator = new TaxCalculator();

    return this.cart.reduce((sum, product) => {
      // Question: What else might we want to change without redesign?
      const tax = taxCalculator.calculateTax(product);
      const productGrandTotal = tax + product.price;
      return sum + productGrandTotal;
    }, 0);
  }
}

```

Program to interfaces not to implementations.

- an interface says only what requests it will receive
- an implementation says how it will handle those requests
- programming to interfaces helps because it
 - lets us easily change an implementation, even at runtime
 - allows applications to send the same request to different classes

```
export interface Juiceable {
    squeeze(): Juice;
}

class Orange implements Juiceable {
    public squeeze() {
        return new Juice("orange juice");
    }
}

class Carrot implements Juiceable {
    public squeeze() {
        return new Juice("carrot juice");
    }
}

class Juice {
    constructor(private name: string) { }
}

class JuiceGarden {

    pickOrange(): Juiceable {
        return new Orange();
    }

    pickCarrot(): Juiceable {
        return new Carrot();
    }
}

// The juicer is programming to interfaces.
// The following only cares that it is dealing with Juiceables.
function orangeCarrotJuice(juiceGarden: JuiceGarden): Array<Juice> {

    const orange: Juiceable = juiceGarden.pickOrange();
    const carrot: Juiceable = juiceGarden.pickCarrot();
```

Depend on abstractions not on concrete classes.

- interfaces and abstractions are similar: neither can exist
- concrete classes can exist (i.e. can become objects)
- to depend on something means a direct reference to it
- The Dependency Inversion Principle (Martin, 1996)
 - Traditionally, high-level modules depend on low-level modules:
 - Higher \rightarrow Middle \rightarrow Lower \rightarrow ...
 - Dependency Inversion inverts that:
 - Higher \rightarrow Abstraction \leftarrow Middle \rightarrow Abstraction \leftarrow Lower ...
- When layering, higher-levels define the abstractions
- and lower-levels implement the abstractions.

```
// This is dependency inversion.
// Both the higher-level juicer and the lower-level components
// depend on an abstraction.
export function juicer(ingredients: Array<Juiceable>): Array<string> {
    // Dependency inversion leverages programming to interfaces.
    return ingredients.map((i) => i.juice());
}

export interface Juiceable {
    juice(): string;
}

// orange and carrot are lower-level modules
export class Orange implements Juiceable {
    public juice() {
        return "orange juice";
    }
}

export class Carrot implements Juiceable {
    public juice() {
        return "carrot juice";
    }
}
```

Don't call us, we'll call you.

- Inversion of Control

A class should have only one reason to change.

- The Single Responsibility Principle ()

Classes should be open to extension and closed for modification.

- The Open-Closed Principle ()

Favour composition over inheritance.

- The Liskov Substitution Principle ()

Only talk to your friends.

- The Law of Demeter ()
- The Principle of Least Knowledge

Strive for loosely coupled designs among objects that interact.
